

'Pro-Tech' what's important to you!!

USB Key Stroke Logger

This device can be connected to a USB keyboard to record all keystrokes. It has a changeable password, keyword search, enable/disable option and stores a total of 2 MB of information (that's 2 million key strokes). It will record chatroom, e-mail, instant messaging, internet activity and anything that is typed into the target PC. The internal memory is non volatile (retains memory even if there is loss of power). The device can be moved from computer to computer and is undetectable by spyware programmes. This product is ideal for keeping an eye on your children's internet activities, employee computer abuse and for snooping on a wayward partner/spouse. It should be noted that as laptop computers have a built-in keyboard, the key logger cannot be used in conjunction with this type of computer.

Now with Time & Date stamping!!

Features:

- Easy to use with no special software required
- Time & Date Stamping on information
